Challenge Overview

Welcome to the **Minihack - Android Security Coding Challenge**! You are given a fully functional Android app called **MomoFactory** — a food delivery app for momos. However, the app contains **critical security vulnerabilities** that need to be identified and fixed.

 **Your Goal:** Find and fix all security vulnerabilities in the MomoFactory app. Your fixes will be validated automatically when you run the tests.

About the App

MomoFactory is a simple food delivery app with the following features:

User Registration

Sign up with username, password, and address

User Login

Authenticate existing users

Dashboard

View profile and membership status (Regular / Pro)

Admin Panel

Hidden admin functionality

 **Note:** The app is intentionally vulnerable. Your task is to find and fix the security issues.

What's Wrong?

The app appears to work correctly, but something isn't right. Explore the code and see if you can spot the issues.

Look Closely at the Manifest

The app asks for more than it needs. A food delivery app only requires internet access and location.

 **Think:** Does a momo delivery app really need camera and contacts?

Who Can Access What?

Some screens in the app are meant to be private. But are they really?

 **Think:** Should the admin panel be accessible from outside the app?

❑ Login Seems Too Easy

Try logging in with: `' OR '1'='1' --` as the username. What happens?

💡 **Think:** How is the SQL query being built? Is it safe?

❑ Becoming a "Pro" User

Try signing up with a username that might break the SQL query. Can you become a **Pro** member without paying?

💡 **Think:** What happens if the username contains SQL code?

>_ What To Do After Fix?

- 1 **Compile and build** your project
- 2 Run the **MomoFactory app** in an emulator

>_ How to Run Tests

After fixing the vulnerabilities, run the following command in the terminal:

```
$ ▶ run tests
```

Example output:

```
Passed: 2 Failed: 1 Total: 2/3
```

Test Command

run tests

Submission

Your work is automatically validated!

When you run `run tests`, your code is automatically tested. You can run this command as many times as you want. Once you pass **all 3 tests**, you have successfully completed the challenge!

Note: There is no separate submission process. Your final score is the result of your last test run.
